Chapter 1. Bridges - Actions and load combinations (Pages I-1 to I-76) /

1. Foreword /
2. Development of the static road traffic load models of EC1.2 /
 - 2.1. Static load model philosophy /
 - 2.2. Statical analysis of European traffic data /
 - 2.3. Traffic scenarios /
 - 2.4. Extrapolation methods /
 - 2.4.1. Half-normal distribution extrapolation method /
 - 2.4.2. Gumbel distribution extrapolation method /
 - 2.4.3. Montecarlo method extrapolation /
 - 2.5. Definition of dynamic magnification factors /
 - 2.5.1. The inherent impact factors /
 - 2.5.2. The impact factors /
 - 2.6. Setup and calibration of the EN 1991-2 traffic load models /
 - 2.7. Other representative traffic load values /
3. The EN 1991-2 load traffic models /
 - 3.1. Division of the Carriageway and numbering of notional lanes /
 - 3.2. Load models for vertical loads /
 - 3.3. Load model n. 1 /
 - 3.4. Load model n. 2 /
 - 3.5. Load model n. 3 - Special vehicles /
 - 3.6. Load model n. 4 Crowd loading /
 - 3.7. Characteristic values of horizontal actions /
 - 3.7.1. Braking and acceleration forces /
 - 3.7.2. Centrifugal force /
4. Combination of multi-component actions /
5. Design values of actions /
 - 5.1. Persistent and transient design situations /
 - 5.2. Accidental and seismic design situations /
 - 5.3. Serviceability limit states /
6. Development of the fatigue load models of EN 1991-2 /
 - 6.1. Fatigue load modeling /
 - 6.1.1. Fatigue verification methods /
 - 6.1.2. Reference traffic measurements /
 - 6.2. The fatigue load models of EN 1991-2 /
 - 6.2.1. Calibration method /
 - 6.2.2. Reference S-N curves /
 - 6.2.3. Fatigue load models /
 - 6.2.4. Accuracy of fatigue load models /
 - 6.3. The λ -coefficient method /
 - 6.4. Partial safety factors γ_M /
 - 6.5. Modeling of vehicle interactions /
 - 6.5.1. Basic assumptions /
 - 6.5.2. Interaction between lorries simultaneously travelling on one lane /
 - 6.5.3. Interaction between lorries simultaneously travelling on several lanes /
 - 6.5.4. The time independent load spectrum /
 - 6.5.5. Time independent interactions /
 - 6.5.6. Some relevant results /
7. Actions on footbridges /

7.1. Field of application /	
7.2. Vertical load models /	
7.2.1. Uniformly distributed loads /	
7.2.2. Concentrated load /	
7.2.3. Service vehicle /	
7.3. Horizontal forces - characteristic values /	
7.4. Groups of traffic loads on footbridges /	
7.5. Application of the load models /	
7.6. Verification regarding traffic induced deformations and vibrations for footbridges /	
7.6.1. Bridge-traffic interaction /	
7.6.2. Dynamic models of pedestrian loads /	
7.6.3. Comfort criteria /	
7.7. Load combinations for footbridges /	
8. Actions on railway bridges /	
8.1. Representation of actions and nature of rail traffic loads /	
8.2. Vertical loads /	
8.2.1. Load Model 71 /	
8.2.2. Load Models SW/0 and SW/2 /	
8.2.3. Load Model "unloaded train" /	
8.2.4. Eccentricity of vertical load models 71 and SW/0 /	
8.2.5. Distribution of axle loads /	
8.2.6. Equivalent vertical loading for earthworks and earth pressure effects /	
8.2.7. Footpaths and general maintenance loading /	
8.3. Dynamic magnification factors Φ (Φ_2 , Φ_3) /	
8.3.1. Definition of the dynamic factor Φ /	
8.4. Application of traffic loads on railway bridges /	
8.5. Horizontal forces - characteristic values /	
8.5.1. Centrifugal forces /	
8.5.2. Nosing force /	
8.5.3. Actions due to traction and braking /	
8.6. Multicomponent actions /	
8.6.1. Characteristic values of multicomponent actions /	
8.6.2. Other representative values of the multicomponent actions /	
8.7. Fatigue load models /	
8.7.1. Assumption for fatigue actions /	
8.7.2. The λ -factor design method /	
8.7.3. Train types for fatigue /	
References /	
Chapter 2. Accidental actions on bridges (Pages II-1 to II-6) /	
Summary /	
1. Introduction /	
1.1. General /	
1.2. Background Documents /	
2. Basis of applications /	
3. Loads due to vehicle collisions /	
4. Design examples of a bridge pier for collision /	
5. Discussion ON Annex C /	
6. References /	
Chapter 3. EN 1991-2, Traffic loads on bridges: example of concrete bridge design (Pages III-1 to III-15) /	
Summary /	
1. Description of the bridge /	
1.1. Geometric characteristics of a single longitudinal beam /	
2. Definition of loads /	
2.1. Structural self weights /	
2.2. Dead loads /	
2.3. Traffic loads /	
2.4. Wind action /	
2.5. Thermal actions /	
3. Calculating the stresses /	
3.1. Distribution of the loads on the main beams /	
3.2. Calculating the maximum stresses on the main beams /	
Chapter 4. EN 1991-2, Traffic loads on bridges: example of steel bridge design (Pages IV-1 to IV-17) /	
Summary /	
1. Description of the bridge /	
1.1. Geometric characteristics of the structure /	
2. Definition of loads /	
2.1. Structural self-weights /	
2.2. Dead loads /	
2.3. Traffic loads /	
2.4. Wind action /	
2.5. Thermal actions /	
3. Calculating the stresses /	
3.1. Behaviour of the structure /	
3.2. Local effects on the deck plate /	
3.3. Calculation methods for the orthotropic deck /	
3.4. Calculating the main structure /	
3.4.1. The effects of self-weight and dead load /	
3.4.2. The effects of traffic loads /	
3.4.3. Wind effects /	

3.4.4. Effects of thermal variations /	
3.5. Calculating the transverse section /	
Chapter 5. Example of steel footbridge (Pages V-1 to V-10) /	
Summary /	
1. Introduction /	
1.1. Background materials /	
2. Definition of the system /	
2.1. The structural system /	
2.2. Properties of the section /	
3. Definition of the actions /	
3.1. Permanent actions /	
3.1.1. Self weight of structural members /	
3.1.2. Deck cover /	
3.2. Snow loads /	
3.3. Wind loads /	
3.4. Thermal loads /	
3.5. Traffic loads /	
4. Combination of actions /	
4.1. Combination of action for the ultimate limit state verification /	
4.2. Combination of action for the serviceability limit state verification /	
5. References /	
Chapter 6. Examples of a composite bridge (Pages VI-1 to VI-21) /	
1. Introduction /	
2. Definition of the system /	
2.1. Details of the system /	
2.2. Load History /	
2.3. Properties of the Section /	
2.3.1. Bending Capacities /	
2.3.2. Moments of Inertia /	
2.4. Resistance of the Transversal Girder and of the Stiffeners /	
3. Definition of loads /	
3.1.1. Permanent Loads Acting on the Structural Steel /	
3.1.2. Permanent Loads Acting on the Composite Beam /	
3.2. Traffic Loads /	
3.3. Actions on Footways /	
3.4. Wind Loads /	
3.4.1. Determination of the Relevant Gust Wind Pressure /	
3.4.2. Horizontal Wind Forces /	
3.4.3. Vertical Wind Forces /	
3.5. Thermal Actions /	
3.6. Effects due to Shrinkage /	
3.7. Temporary Loads during Construction /	
4. Calculation of internal forces /	
4.1. Distributions of Characteristic Loads on the Bridge Deck /	
4.2. Bending Moments in the Construction Stage (Continuous Beam) /	
4.2.1. Moments due to permanent loads during Erection /	
4.2.2. Moments due to Temporary Loads during Erection /	
4.2.3. Moments due to Vertical Wind Loads during Erection /	
4.3. Bending Moments in the Final Stage /	
4.3.1. Moments due to Permanent Loads /	
4.3.2. Moments due to Traffic Loads /	
4.3.3. Moments due to Loads on the Footway /	
4.3.4. Moments due to Vertical Wind Forces /	
4.4. Internal Forces Acting on the Transversal Girder and the Stiffeners /	
4.5. Summary of the Relevant Internal Forces /	
4.5.1. Bending Moments in the Bridge Girder /	
4.5.2. Internal Forces in the Transversal Girder and the Stiffeners /	
5. Verifications /	
5.1. Verification for the Ultimate Limit State /	
5.1.1. General /	
5.1.2. Verification of the Steel Girder in the Erection Stage /	
5.1.3. Verification of the Composite Beam in the Final Stage /	
5.1.4. Verification of the Transversal Girder and the Stiffeners /	
5.2. Verification for the Serviceability Limit State /	
6. References /	
Chapter 7. Design of composite bridges according to EN 1990 and EN 1991. Case study (Pages VII-1 to VII-14) /	
1. Introduction /	
1.1. Aims /	
1.2. Scope /	
1.3. Organisation of the contribution /	
2. Constraints /	
2.1. Situation /	
2.2. Functionality /	
2.3. Construction /	
3. Conceptual design /	
3.1. Layout of the bridge /	
3.2. Bridge deck /	
3.3. Construction /	
4. Actions, influences and countermeasures /	

4.1. Introduction	/
4.2. Recognition of actions and influences, adoption of countermeasures	/
4.2.1. Permanent actions	/
4.2.2. Variable actions	/
4.2.3. Accidental actions	/
4.3. Failure mode and reliability	/
4.4. Relevant design situations	/
4.4.1. Overview	/
4.4.2. Design situations for the verification of Ultimate Limit States	/
4.4.3. Design situations for the verification of Serviceability Limit States	/
5. Action models	/
6. Calculation of actions effects	/
7. Combination of actions	/
7.1. Transient design situation Construction	/
7.2. Persistent design situation Traffic	/
7.3. Persistent design situation Temperature	/
8. Concluding remarks	/
References	/
Appendix A. Properties of selected materials	/
Summary	/
1. Properties of concrete	/
1.1. Introduction	/
1.2. Concrete classes	/
1.3. Time-dependence of concrete mechanical parameters	/
1.4. Creep and shrinkage	/
1.5. Durability	/
Example	/
2. References	/
