Eurocode handbook 5. Design of buildings for the fire situation

Издательство

250 стр; формат: 30 x 21 см; библиографический список: 172 единицы

Ключевые слова:

Содержание.

I. Fire actions in buildings (Pages I.1 to I.81) /
- Summary /
- 1. Introduction /
  - 1.1. General principles for conventional fires /
  - 1.2. General principles for natural fires /
    - 1.2.1. General /
    - 1.2.2. Natural fire models /
    - 1.2.3. Rules according to 3.3 of EN 1991-1-2 for simplified fire models /
    - 1.2.4. Rules according to 3.3 of EN 1991-1-2 for advanced fire models /
  - 1.3. Methodology /
    - 1.3.1. General presentation /
    - 1.3.2. Performance based objective /
    - 1.3.3. Models for the fire development /
    - 1.3.4. Models for the structural behaviour in the fire situation /
    - 1.3.5. Required data /
- 2. Characteristics of the fire compartment /
  - 2.1. Introduction /
  - 2.2. Boundary elements of the compartment /
  - 2.3. Thermal characteristics of boundaries /
  - 2.4. Opening characteristics /
  - 2.5. Mechanical ventilation /
- 3. Characteristics of the fire /
  - 3.1. Introduction /
  - 3.2. Fire load /
    - 3.2.1. Nature of fire load /
    - 3.2.2. Amount of fire load /
  - 3.3. Type of fire /
  - 3.4. Rate of heat release /
  - 3.5. Design RHR evolution /
  - 3.6. Experimental data /
- 4. Fire development models /
  - 4.1. Pre-flashover fires /
    - 4.1.1. Flame not impacting the ceiling / Heskestad's method /
    - 4.1.2. Flame impacting the ceiling / Hasemi's method /
    - 4.1.3. Two zone model, advanced calculation model /
    - 4.1.4. Combination between 2 zone model and localised fire model /
  - 4.2. Fully developed fires /
    - 4.2.1. Natural fire curves NATFIR /
    - 4.2.2. Parametric fire according to ANNEX A of EN 1991-1-2 /
    - 4.2.3. Zone model, advanced calculation model /
  - 4.3. Combination of 1-zone and 2-zone models /
- 5. Heat transfer models /
  - 5.1. Heat flux /
  - 5.2. Temperature development inside structural members /
    - 5.2.1. General /
    - 5.2.2. Simple calculation model for unprotected steelwork /
    - 5.2.3. Simple calculation model for steelwork insulated by fire protection material /
- 6. Structural models /
  - 6.1. Introduction /

6.1.1. Schematisation of the structure /
6.1.2. Design procedures /
6.2. Mechanical actions /
6.3. Tabulated data /
6.3.1. Concrete structural elements /
6.3.2. Composite steel-concrete structural elements /
6.4. Simple calculation models /
6.4.1. Concrete structural elements /
6.4.2. Steel structural elements /
6.4.3. Composite steel-concrete structural elements /
6.5. Advanced calculation models /
6.5.1. Introduction /
6.5.2. Application examples /
References /
II. Accidental combinations in case of fire (Pages II.1 to II.14) /
1. Introduction /
1.1. Background documents /
1.2. General principles /
2. Fundamental cases of structural reliability /
2.1. General /
2.2. Evaluation of the combination factor ψ for actions /
2.2.1. Introduction /
2.2.2. Probabilistic requirements /
2.2.3. Design procedure using the partial factor method /
2.2.4. Reliability analysis /
2.2.5. Optimisation /
2.2.6. Conclusions /
References /
Attachment /
III. Calibration of reliability parameters (Pages III.1 to III.30) /
1. Introduction /
1.1. Background documents /
1.2. General principles /
2. Full Probabilistic approach /
2.1. General presentation /
2.2. Applied structural safety on the basis of the probabilistic approach /
2.3. Steel beam in the fire situation /
3. Semi-probabilistic approach /
3.1. Calibration of the global factor related to the fire load /
3.2. Calibration of partial and differentiation factors related to the risk of fire activation and to the active fire safety measures /
3.2.1. Danger of fire activation related to the size of the compartment /
3.2.2. Danger of fire activation related to the occupancy /
3.2.3. Influence of active fire safety measures /
References /
IV. Life safety considerations (Pages IV.1 to IV.9) /
1. Introduction /
1.1. Background documents /
1.2. General principles /
2. Bayesian network applied to life safety /
2.1. Introduction /
2.2. Probabilistic concepts /
2.3. Bayesian network /
2.4. Risk assessment /
2.5. Conclusions /
References /
V. Properties of materials (Pages V.1 to V.28) /
1. Introduction /
2. Thermal properties of concrete /
2.1. Normal weight concrete /
2.2. Lightweight concrete /
2.3. Density /
3. Thermal properties of steel /
4. Mechanical properties of concrete /
4.1. Strength and deformation properties of concrete /
4.2. Concrete stress-strain relationships adapted to natural fires with a decreasing heating branch for use in advanced calculation models /
5. Mechanical properties of steel /
5.1. Strength and deformation properties of structural steel /
5.2. Strength and deformation properties of reinforcing steels /
6. Determination of material properties by numerical simulation of real tests /
6.1. Application to the thermal properties of concrete /
6.2. Application to the mechanical properties of steel /
References /
VI. Example of reinforced concrete structure (Pages VI.1 to VI.13) /
Summary /
1. Introduction /
2. Design conditions /
2.1. Building characteristics /

2.2. Structural characteristics /
2.3. Definition of the limit state equation /
2.4. Combination of actions /
2.4.1. Permanent situation for normal temperature design /
2.4.2. Accidental situation in the fire situation /
3. Design fire /
3.1. National requirements /
3.2. Equivalent time of fire exposure /
4. Fire resistance design /
4.1. Tabulated data design /
4.1.1. Beams /
4.1.2. Columns /
4.2. Temperature analysis /
4.3. Cross-section resistance /
4.3.1. Beams /
4.3.2. Columns /
4.4. Conclusions /
References /
VII. Examples of steel and composite structures (Pages VII.1 to VII.48) /
1. Introduction /
2. Isolated structural elements /
2.1. Heating according to the standard fire /
2.1.1. Design of a not protected steel column /
2.1.2. Analysis of temperatures in a composite beam with insulated steel section /
2.1.3. Design of a composite beam comprising a steel beam with partial concrete encasement /
2.2. Heating according to natural fires /
2.2.1. Underground car-park, Auchan Phase II (1999-2000) /
2.2.2. Steel column in underground car-park /
3. Frame analysis for natural fires /
3.1. School Campus "Geesseknappchen" in Luxembourg /
3.1.1. Temperature field calculation /
3.1.2. Mechanical behaviour of the structure /
3.2. Frame with composite columns and composite beams /
4. Application of the semi-probabilistic approach /
4.1. Essentials /
4.2. Comparison between deterministic and semi-probabilistic approach /
4.2.1. Case study: Hotel - 5 levels /
4.2.2. Case study: School-3 levels with library on ground level / I
4.3. Global fire safety concept applied to Banque Populaire /
4.4. Global fire safety concept applied to Chambre de Commerce /
References /
VIII. Case studies of real fires (Pages VIII.1 to VIII.17) /
1. Introduction /
1.1. The great Lisbon fire - 1.11.1755 /
1.2. The great Boston fire - 20.3.1760 /
1.3. The great Chicago fire - 8.10.1871 /
2. Recent conflagrations /
2.1. Great fire, Chiado: Historical centre of Lisbon - 28.8.1987 /
2.1.1. Characterization of the situation /
2.1.2. The fire development /
2.1.3. The reconstruction and lessons learnt /
2.2. Great fire, Duesseldorf Airport - 11.4.1996 /
2.2.1. Situation on active measures /
2.2.2. Fire activation and fatal issues /
2.2.3. Recommendations /
2.3. Great fire, Goteborg Disco - 30.10.1998 /
2.3.1. The fire /
2.3.2. The SP investigation /
2.3.3. Summary /
2.4. Great fire, Windsor tower Madrid - 12.2.2005 /
2.5. Endless list... /
References /
IX. Available software (Pages IX.1 to IX.3) /
Summary /
1. Fire resistance models /
1.1. Simple calculation models /
1.1.1. Model "AFCB" /
1.1.2. Model "AFCC" /
1.1.3. Model "HS-CC" /
1.1.4. Nomogram /
1.2. Advanced calculation models /
2. Fire development models /
2.1. Simplified fire model /
2.2. Advanced fire model /
3. Probabilistic model /
References /
